Preface

Welcome to Sugar, an open source Customer Relationship Management (CRM) application.

Sugar enables organizations to efficiently organize, populate, and maintain information on all aspects of their customer relationships. It provides integrated management of corporate information on customer accounts and contacts, sales leads and opportunities, plus activities such as calls, meetings, and assigned tasks. The system seamlessly blends all of the functionality required to manage information on many aspects of your business into an intuitive and user-friendly graphical interface.

The system also offers a graphical dashboard to track the sales pipeline, the most successful lead sources, and the month-by-month outcomes for opportunities in the pipeline.

Sugar is based on an open source project, and therefore, advances quickly through the development and contribution of new features by its supporting community.

Welcome to the community!

Audience

The *Sugar Upgrade Guide* is designed for administrators who want to upgrade to the latest version of the Sugar application.

Overview

Sugar consists of modules, each of which represents a specific functional aspect of CRM such as Accounts, Activities, Leads, and Opportunities. For example, the Accounts module enables you to create and manage customer accounts, and the Activities module enables you to create and manage activities related to accounts, opportunities, etc. These modules are designed to help you manage customer accounts through each step of their lifecycle, starting with generating and qualifying leads to customer support and resolving reported bugs. Because many of these steps are interrelated, each module displays related information. For example, when you view the details of a particular account, the system also displays the related contacts,

activities, opportunities, and bugs. You can not only view and edit this information but also create new information.

As an administrator, you have the power to implement access control for these modules. You can customize the look and feel of Sugar across your organization. You can even create new modules if needed. You can also create multiple forums as platforms of discussion on various topics amongst your users and customers.

Related Documentation

Refer to the following guides for related information:

- *Sugar Enterprise User Guide, Sugar Professional User Guide, and Community Edition User Guide*: Describe how to use Sugar modules.
- *Sugar Enterprise Installation and Administration Guide, Sugar Professional Installation and Administration Guide, Sugar Community Edition Installation and Administration Guide*: Describe how to install Sugar and perform administrative tasks.

Upgrading Sugar

This document describes how to upgrade from Sugar versions 5.1, and 5.2 to version 5.5 Beta1.

In order to upgrade your Sugar application, you need to download the appropriate Upgrade zip file from the Sugar website to your local machine. For Sugar Enterprise and Sugar Professional, you can obtain the Upgrade zip file from the Sugar Support Portal at <https://www.sugarcrm.com/crm/support> and upload it to your local machine. For Sugar Community Edition, you can upload the Upgrade zip file from the SugarCRM Web site to your local machine.

To use the Upgrade Wizard, you need to log into the Sugar application. To use the Silent Upgrader, you need to run a PHP script from the command line on the server where the Sugar instance is installed.

CAUTION: Do not upgrade your production system to 5.5 Beta 1 because you cannot upgrade from 5.5 Beta 1 to 5.5 GA. It is strongly recommended that you run the upgrade process on a copy of your production system.

Compatibility Matrix for Upgrade

PHP version	5.2.1-5.2.6, 5.2.8, 5.2.9
Databases	MySQL, MSSQL, and Oracle (Oracle is supported only for Sugar Enterprise)
Operating systems	Windows: XP, 2003, Vista, Linux: Red Hat 4.x, 5.x (Advanced Server, Enterprise Server); Oracle Enterprise Linux 5.1; CentOS 4.x, 5.x Mac: OS X

Upgrade Prerequisites

- Backup your system before beginning the upgrade process. It is imperative to backup your current Sugar directory and database.
- If op-code caching is enabled in the PHP configuration file, you will need to disable it before upgrading your Sugar installation. You can enable it after the upgrade process is complete.

- If you are using Zend Core 2.0, you will need to increase the default value of the parameters listed below before you begin the upgrade process:
 - Navigate to *C:\Program Files\Zend\Core\etc\fastcgi.conf* and increase the default value for *ConnectionTimeout* to 3000 and *RequestTimeout* to 6000.
 - Navigate to the *php.ini* file and increase the default value of *max_execution_time* to 6000.
 - Because the upgrade files are large, do the following:
 - In the Advanced section of the System Settings page of your current Sugar installation, modify and save the value of Maximum upload size to 21000000 (20MB).
 - Navigate to the *php.ini* file on your Web Server and configure the parameters listed below as follows:
 - Set *post_max_size* to more than 20MB.
 - Set *upload_max_filesize* settings to more than 20MB.
 - Set *max_input_time* to a large number.
- Restart the Web Server and then begin the upgrade process.
- If you are using an Apache Web Server and if you have set *LimitRequestBody* in the *httpd.conf* file, then ensure that you set it to a large number or use the default value of 2GB. Restart Apache and then begin the upgrade process.
 - Ensure that the *Webserver user* has Write permissions to the Sugar database. The upgrade to Sugar 5.5 will add and replace files in several locations including the Sugar root directory. The *Webserver user* must have Write permissions for the root folder and all sub-directories during the upgrade process.
 - The process of upgrading can take up to 30 minutes. If you are using the IIS Web server, ensure that the CGI application does not time out. To do this, on IIS, set the CGI script timeout to more than 300 seconds, which is the default value.
 - If you have customized any module's PHP file, for example, *accounts.php*, it is strongly recommended that you save it in the Customs directory and not within the main module. This is because, during upgrade, existing customizations may be overridden by changes in Sugar 5.5.

Using the Upgrade Wizard

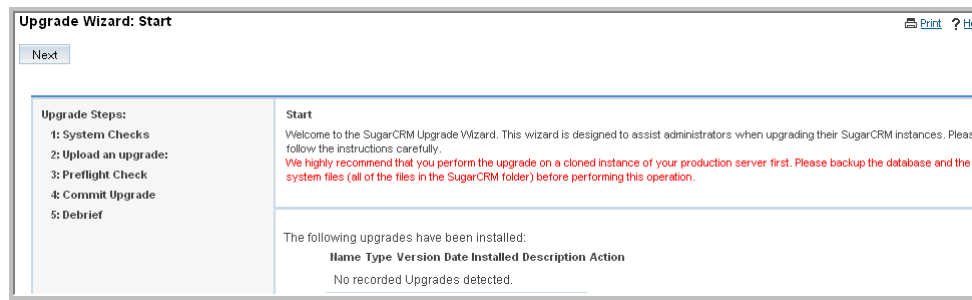

The Upgrade Wizard provides a quick way to upgrade to the latest version of the Sugar application. The Upgrade Wizard includes critical upgrade logic as well as the SQL commands needed to upgrade the application.

Before using the Upgrade Wizard, ensure that the *config.php* file for your installation is writable.

Note: Attempting to manually upgrade by simply replacing files and running the upgrade SQL is not supported.

To upgrade Sugar using the Upgrade Wizard

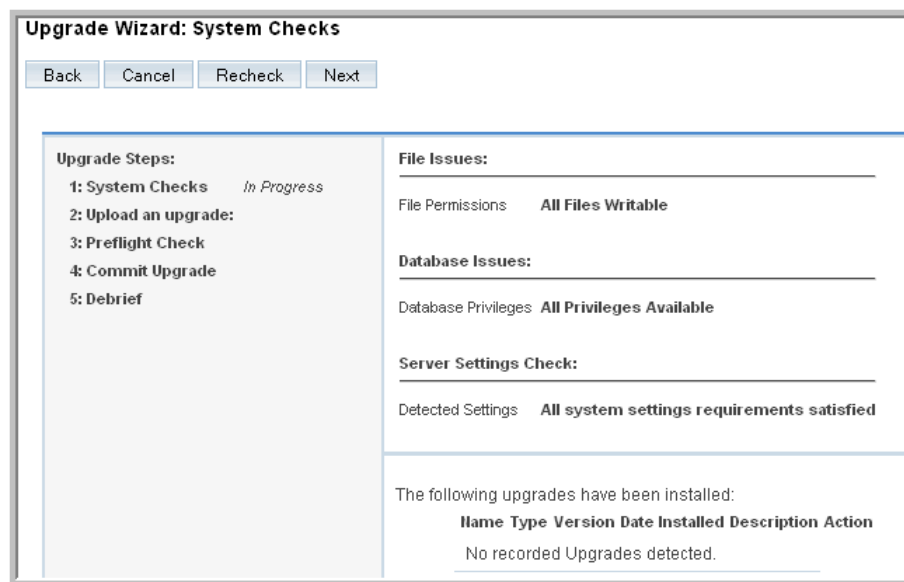

1. Download the appropriate Sugar Upgrade zip file from the Sugar Website to your local machine. For example, to upgrade Sugar Professional from version 5.2 to 5.5 Beta 1, you need to download the *SugarPro-Upgrade-5.2.0-to-5.5.0beta1.zip*.
2. Log into your existing Sugar application as the administrator and click **admin** on the right-hand corner of the page.
3. In the Systems panel of the Administration Home page, click **Upgrade Wizard**.

The Upgrade Wizard screen displays on the page.

4. Click **Next**.

The System Checks screen displays on the page.

5. Click **Next**.

The Upload an Upgrade screen displays on the page.

Upgrade Wizard: Upload an upgrade:

Back Cancel Recheck

Required steps must be completed before continuing.

Upgrade Steps:

- 1: System Checks *Complete*
- 2: Upload an upgrade: *In Progress*
- 3: Preflight Check
- 4: Commit Upgrade
- 5: Debrief

Upload an upgrade:

The following upgrades are ready to be installed:

Name	Type	Version	Date Published	Uninstallable	Description
None					

The following upgrades have been installed:

Name	Type	Version	Date Installed	Description	Action
No recorded Upgrades detected.					

6. Click **Browse**, navigate to the location of the Upgrade zip file, and select it.
The path to the file displays in the Upload an upgrade field.
7. Click **Upload Upgrade** to upload the package to the Sugar application.
The system uploads the package and displays it on the page.
Click **Next**.
The Preflight Check screen displays on the page.

Upgrade Wizard: Preflight Check

Cancel Recheck Next

Preflight Check

All Preflight tests passed. Press "Next" to commit these changes.

Upgrade Steps:

- 1: System Checks *Complete*
- 2: Upload an upgrade: *Complete*
- 3: Preflight Check *In Progress*
- 4: Commit Upgrade
- 5: Debrief

Schema Changes [Show Schema Change Script](#)

Character Set Schema Changes *Not needed.*

Database Update Method
Upgrade Wizard Runs SQL

The following upgrades are ready to be installed:

Name	Type	Version	Date Published	Uninstallable	Description
None					

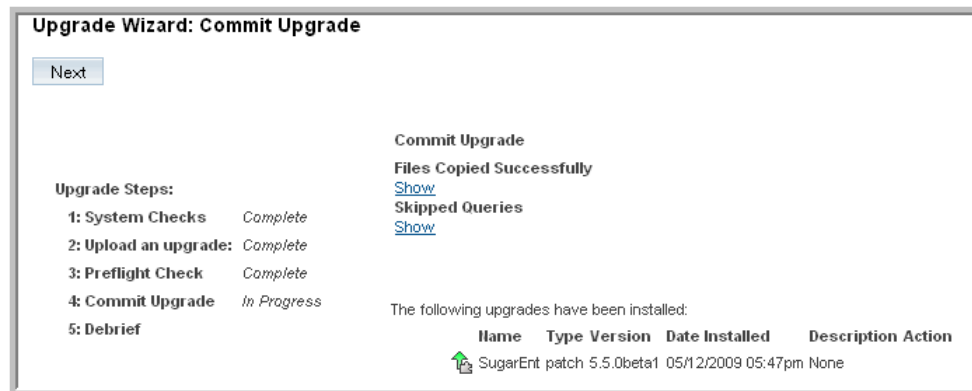

The following upgrades have been installed:

Name	Type	Version	Date Installed	Description	Action
No recorded Upgrades detected.					

By default, the Upgrade Wizard Runs SQL option is selected as the database update method. If you ran the SQL queries manually, select **Manual SQL Queries** from the Database Update Method drop-down list and select the **Check when SQL has been manually run** box.

8. Click **Next**.

The Commit Upgrade screen displays on the page.

Optionally, you can click **Show** to see a list of files that were copied and the rebuilt results. You can also view skipped queries.

9. Click **Next**.

The Debrief screen confirms that the upgrade has been installed.

10. Click **Done**.

The upgrade is now complete.

11. In the Systems panel of the Administration Home page, click **Repair** and select the Rebuild Relationship and Rebuild Extensions options to perform these actions. For more information, see the *Installation and Administration Guide* that is appropriate to your Sugar application.
12. If you unchecked any files to prevent the Upgrade Wizard from overwriting then manually merge the files by extracting the skipped file from the patch zip file. Merge the file that was installed in the Sugar application directory.

Note: If your attempt to upgrade Sugar is unsuccessful, check the *upgradeWizard.log* file in the Sugar folder for information.

Using the Sugar Silent Upgrader

The Silent Upgrader enables you to avoid some of the limitations that the Web application environment may have that prevents the Upgrade Wizard from completing the upgrade. The upload size limit (by PHP and sometimes even by Web server), the CGI (or equivalent) timeout limit, and the MySQL (or equivalent) session timeout limit are some of the challenges people run into when upgrading to Sugar 5.5 Beta 1. The Silent Upgrader either avoids the limitations or better controls the settings in its stand-alone execution environment.

Note: The *silentUpgrade.php* script creates new files for the user who is running it. For example, for the root user it create files as user/group root. Because Apache cannot read this, you must ensure that the Web server user has the permissions to read and write the script.

To upgrade Sugar using the Silent Upgrader

1. From the command line on the server where the Sugar instance is installed, execute the *silentupgrade.php* script as follows:

```
php.exe -f silentUpgrade.php [upgradeZipFile] [logFile]  
[pathToSugarInstance] [adminUser]
```

where:

upgradeZipFile is the full path to the upgrade zip file. For example, SugarCE-Upgrade-5.2.0-to-5.5.0beta1.zip

logFile is the full path to the log file.

pathToSugarInstance is the full path to the instance being upgraded.

adminUser is a valid admin user name.

Note: After upgrading to Sugar 5.5.0 Beta 1, you will need to rebuild the relationship metadata. To do this, log into Sugar as the administrator. On the Administration Home page, select the Repair option in the Systems sub-panel and click Rebuild Relationships.

Locking Down the Upgrade Wizard

If you are managing multiple instances of the Sugar application and you want to maintain complete control over the Sugar instances, you can lock down the Upgrade Wizard to ensure that no user with administrative privileges can upgrade any of them. To lock down functions on the Administration page

1. Navigate to the *config.php* file in the Sugar root directory.
2. Set the following parameter to `true` as below:

```
$sugar_config['admin_access_control']=true
```
3. Save the file.
